

XCI EZ ZONING

It's time.

Contact your XCI Zoning Specialist

You have one thermostat and 10 rooms.

How's that going for you?

We have a better idea...

Perfect Control, perfect comfort, every room.

No doubt you have been frustrated with the lack of individual climate control in your home. Every room has different heating and cooling requirements that vary greatly within a 24 hour period.

A single thermostat provides very few options for perfect, energy efficient climate control. The SmartZone™ system is designed to create perfect comfort in each room, saving you time, energy and money. It's simply the perfect solution for today's demanding energy needs.

Will I save money?

Your heating and air conditioning equipment consumes a large part of your utilities each month. By heating and cooling only the areas of your home that are occupied, your equipment runs less often and for a shorter amount of time. Less run time means lower utility bills and less wear and tear on your equipment.

But there's more to the XCI EZ system than saving money. The use of energy-efficient products will help to save the environment. When you use less energy, less electricity needs to be produced, ultimately resulting in a smaller carbon footprint.

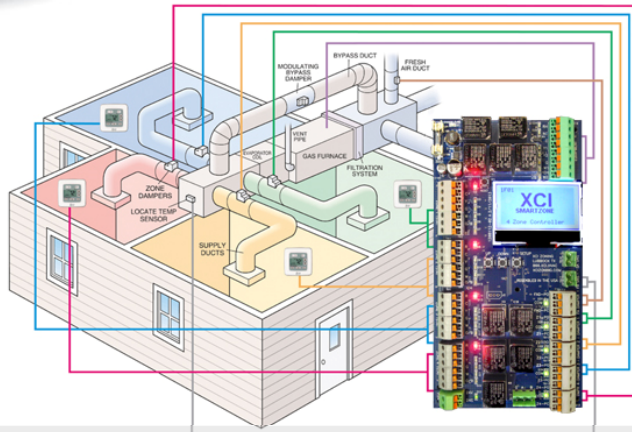

Is it complicated?

Not at all, especially when you pair the XCI EZ control system with programmable thermostats. Program your zones once, and each thermostat will achieve the right temperature at the right time. Go about your day and forget about adjusting the thermostat.

Modern thermostats use state-of-the-art technology with a very intuitive, user-friendly interface. Initial programming is quick, painless and can be adjusted easily should your comfort needs change at any time.

Your HVAC professional has been trained in designing and installing a zone system for your home. Whether installing new equipment or adding zoning to your existing HVAC system, the XCI EZ control system provides a simple solution for improved comfort in your home.

How does it work?

Each room in your home has a "vent", or duct that brings air from the HVAC system into the room. The XCI EZ control system utilizes a motorized damper and a thermostat for each duct, commonly called a "zone". Multiple rooms can be tied together into a single zone.

When a zone thermostat turns on the equipment (makes a call), the control system will close the damper on any zone that is NOT making a call. Only the zone calling will receive any air. Once that zone is satisfied, the equipment will turn off. A bypass damper keeps the air pressure balanced in the ductwork to prevent air noise. By only heating or cooling the rooms that are occupied, the HVAC equipment runs for a shorter amount of time, saving money on utilities and increasing the service life of the HVAC equipment.
